

Project Name : Smart Data Fetcher

Objective : Android app to fetch data from the server to display information of the users.

API : <https://jsonplaceholder.typicode.com/posts>

Challenges : Not found API that will return selected page if page number passed hence I have implemented endless scrolling after assuming that each request will give more 100 records.

Developer Name : Bhavesh panwar

Date : 22/04/2024

Tools and Language	Kotlin (1.9.0) and Android Studio Iguana
Design Pattern	MVVM
Libraries used	Hilt for the DI, Retrofit to get and post data
Navigation	Navgraph , Parcelable class to pass data to destination fragment using safe args
